

Rotaserve sustainability vision

Our approach is in line with the Corporate Sustainability Reporting Directive (CSRD) and aligns seamlessly with your Sustainable Development Goals (SDGs) on which your company needs to report by 2024. We focus on the circular economy and look for long-term solutions. Replacement is applied only when absolutely necessary, using sustainable design solutions. This means we minimise the number of parts and ensure that the product lasts for a long time with high efficiency. We strive to make pumps suitable for long-term use in a circular world, rather than seeing the pump as a disposable product. This is in line with the objectives of the Corporate Sustainability Reporting Directive part of the Green Deal agreement.

Rotaserve is a Kirloskar group company

Rodelta Pumps International B.V., Rotaserve B.V., Kirloskar Pompen B.V.

FIRST STEP TO YOUR SOLUTION

ROTASERVE®
Pump Maintenance, Support & Optimization

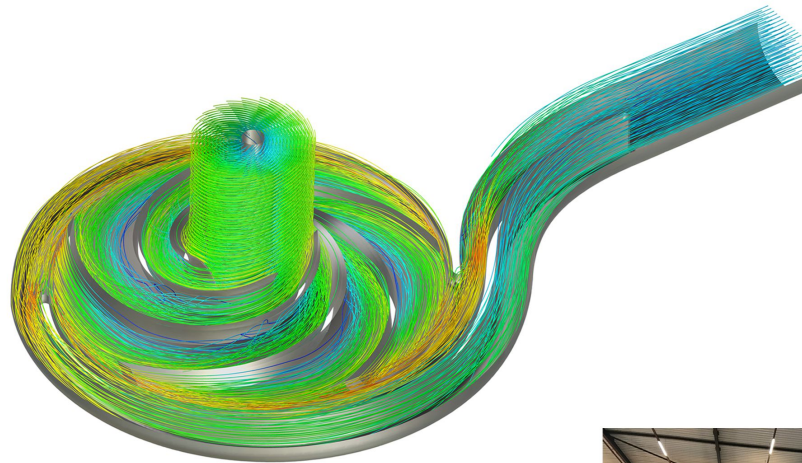

Rotaserve is a service company that specializes in repairing, overhauling and upgrading of pump systems. What differentiates us from other service companies is that we are part of Rodelta and Kirloskar Pumps and therefore have access to the knowledge and expertise in designing and manufacturing of pumps. In recent years, Rodelta and Kirloskar have increasingly been asked to service their pump systems. Our customers want to be sure that they were making the right decisions regarding pump systems. Rotaserve is the answer to this demand. Thanks to this relationship with a pump manufacturer, we have a comprehensive engineering department in Almelo that supports us in every upgrade of your pump installation. Furthermore, all pumps are checked on our test bed and provided with a warranty certificate. As a customer, you actually talk directly to the pump manufacturer.

Rotaserve analyzes your pumping system and tries to upgrade it first before replacing it. This is called "retrofit" In this process, the rotating part will be replaced with a new, more efficient version, without modifying the piping system or pump housing.

Most pumps operate far from the Best Efficiency Point (BEP), leading to higher energy costs - the biggest cost on pumps. Our energy scan shows how the installation can be improved to reduce costs by increasing efficiency.

Efficiency, noise and vibration are vital factors to consider. Noise can cause environmental nuisances and vibration leads to wear and tear on seals and bearings. A detailed installation analysis is necessary to address these issues.

Our approach is distinct because we are both designers and manufacturers of pumps and are therefore constantly looking for the best solution.

Rotaserve offers the following services:

- Energy scans to optimize your installation.
- Pump repair services, including overhaul of various brands. (Did you know that Delta pumps, Sulzer Delta pumps and VDA are also overhauled by Rotaserve because this is under the legacy of Rodelta).
- Pump testing with test certificates, possibly with warranty certificate.
- Retrofit solution to improve hydraulic performance without modifying piping.
- Analysis of vibration, cavitation and noise problems.
- "One-stop shop" for analysis, repair, upgrade, testing and warranty.
- Hydraulic engineers for upgrade, flow studies, water hammer and resistance calculations.
- Spare parts for all (phased-out) pump types.
- Possibility to attend all tests at the factory in the Netherlands.

- Total floor area: 9,600 m²
- Assembly shop lifting capacity a.o. 2x16,000 kg
- Hydrostatic testing capabilities up to 250 bar
- Repair and service area
- Balancing machine
- Meeting and training rooms
- Spare parts warehouse with spare parts
- Hydraulic engineering & design team
- Own test facility

Diagnostic & consulting services

Rotaserve provides energy scans & on-site inspections and monitoring services

Maintenance & support services

Fast Track spare parts, on-site service, workshops, preventive & corrective maintenance

Technical & economical optimization

Rotaserve provides upgrades, modifications and services to optimize hydraulic performance and increase reliability.
